

After years of run time with our current propulsion systems, we turned to ECM in 2019 and asked them to design a motor optimized especially for our IVER4-900 series of autonomous underwater vehicles [AUVs]. We needed the propulsion system to be highly efficient, super quiet, and more compact. ECM delivered.

Following exhaustive testing, both in the lab and in water, we have standardized on the ECM-design. Our IVER4-900s with ECM PCB stator motors are slated to ship to customers on multiple continents starting in late 2022.

IVER4 900 UUV

The Iver4 900 UUV offers users a new 300-meter workhorse system featuring long duration capability.
